Cracow University of Economics

The Energy Union Tour – success or failure?

Abstract: The objective of the Energy Union is to integrate 28 national energy markets, guarantee free movement of energy through the borders of the member states, implement new technologies, increase energy efficiency and renew transmission infrastructure. This project is advocated in response to the energy crisis of 2009, between Russia and Ukraine, as a result of which the gas transit to some of the EU countries was discontinued. This project, however, does not enjoy equal interest among all EU member states. This is the outcome of the national interests of some member states, which, for many years, have had good political and economic relations with the Russian Federation, particularly in the area of energy raw materials. Therefore, Maroš Šefčovič – the European Commissioner in charge of the Energy Union, organised an Energy Union Tour, i.e. a series of meetings in all the member states, taking place at the turn of 2015–2016, the objective of which was to show what the Energy Union could offer each of them. The structure of the paper was determined by the research procedure and the response to all the research questions, comprising: introduction, reflections on the security of the energy raw material supply and the projects of Energy Union and Energy Union Tour as well as the conclusions from the research and the summary.

Key words: Energy Union Tour, Energy Union, energy security, energy policy, internal energy market

On 25th February 2015, the European Commission adopted a package of documents concerning the foundation of an Energy Union. The adopted package postulates the creation of an Energy Union based to a large extent on the objectives of the climate policy which first and foremost concerns the market of electrical energy and, in some cases – of natural gas. The Energy Union is a project which is, among others, a reaction to the energy crisis of 2009 between Russia and Ukraine, the consequences of which revealed the necessity to take definite action aimed at working out a common standpoint in energy policy and energy security.

This project, however, does not enjoy equal interest among all EU member states. This is the outcome of the national interests of some member states, which, for many years, have had good political and economic relations with the Russian Federation, particularly in the area of energy resources.

Therefore, Maroš Šefčovič – the European Commissioner in charge of the Energy Union, organised an Energy Union Tour, i.e. a series of meetings in all the member states, taking place at the turn of 2015–2016, the objective of which was to show what the Energy Union could offer each of them: beginning with better interconnections of energy, through improvements in market competitiveness ending with the security of the gas supply etc. Each meeting was summarised with a comprehensive analysis and report presenting potential benefits in each state’s participation in the Energy Union.

This paper is an attempt to find answers to the following research questions:
– why do specific member states favour or not the concept of the Energy Union?
– what are the benefits of the Energy Union for specific member states?
– has the Energy Union Tour changed the approach towards the project of the Energy Union manifested by specific member states?

1. The security of supplies of energy resources within the EU

Currently the European Union is the largest importer of primary energy in the world, as more than a half of the energy consumed in the EU (53.5%) is imported (Complete Energy Balances). At the same time, these imports come from a relatively small number of suppliers, which bears a potential risk for the security of supplies. A special threat is posed by the fact that approx. 30% of each of the contemporary key energy carriers, such as crude oil, gas or coal imported to the European Union is purchased most frequently from Russia (cf. Fig. 1). Therefore a large concentration of the imports of energy carriers from Russia becomes its string bargaining chip in economic relations with the European Union and impacts its resource dependence on Russia.

**Fig. 1. The main suppliers (to the EU-28) of key energy resources in 2014**

![Fig. 1. The main suppliers (to the EU-28) of key energy resources in 2014](source)

The gas crisis, occurring in winter 2009, revealed the problem of the security of the energy resource supply to the EU as well as its large dependence on the import of this resource from a single supplier, i.e. Russia. As a result of the crisis, the transit of gas to the EU through the territory of Ukraine was stopped. Slovakia and some Balkan states had to ration this raw material and close down some factories and power plants, which bore significant costs for their economies (Aalto, 2016, pp. 20–25).

However, the dependence of EU member states on the import of Russian gas, varies from one country to another. And in the case of Baltic countries and Finland, it is 100%, whilst for France, this index is merely 19% (cf. Fig 2). Such diversification makes it difficult for the European Union to take a unified standpoint towards Russia.

Given the large diversity of import dependence and the problems involved with the existence of numerous energy strategies, different in each of the 28 EU member states, the need for even stronger integration of the internal energy market has become a priority.
The Energy Union is a project in response to the gas crisis from 2009 between Russia and Ukraine. The consequences of the Russian-Ukrainian conflict revealed the necessity of definite measures in the context of working out a common standpoint in energy policy issues. These events have shown how important it is for the EU to build not only a common energy market, but also the mechanisms of co-operation aiming at increasing the energy security of EU member states (Pach-Gurgul, 2016a, pp. 218–220).

The Energy Union is an EU project consisting of the integration of 28 national energy markets into one common market and also geared towards restructuring the entire energy system of the EU by means of the construction of energy connections, diversification of the sources of energy and its transmission, taking into consideration the objectives of the climate policy.

2. The Energy Union Project

The objective of the Energy Union is to provide a mechanism of energy security, first of all for the countries which are dependent on their supplies of energy resources (e.g. gas) from one source, which weakens their bargaining position in the negotiations of contracts for the supply of natural gas (Buchan, Keay, 2016, pp. 150–152). A significant problem in the creation of the Energy Union is posed by the fact that member states in western and Central Eastern Europe represent two different approaches to this issue.
The countries and companies in the western part of the EU believe that the gas market is enough liquid for them and thus it should be shaped by business and purely economic factors. The countries within Central and Eastern Europe, though, which have had less than ideal experience in this matter, being numerous times in difficult situations regarding his, claim that they pay much more than other countries in the western part of the EU for their supplies of gas (cf. Fig. 3).

**Fig. 3. The process of Russian gas for recipients in the EU in 2013 (1000 m³/USD)**

Therefore, this region has the largest demands that the European Union should take better advantage of its political position in order to secure better terms for the purchase of gas. That said, there are also exceptions in this group of countries, such as Hungary, which is sceptical about the Energy Union and fears that the European Commission will interfere in their relationships with Russia.

Thus the objectives of the Energy Union do not share equal interest among all EU member states. This is also related to the national interests of some countries which for many years have had a good relationships with the Russian Federation, not only in the sector of energy resources. These EU member states have such a developed energy infrastructure and also sufficient reserves of energy resources that they do not seek any change of the existing co-operation mechanisms. In this context, there are increasing controversies around the strong collaboration between Germany and Russia, resulting in the creation of the gas pipelines Nord Stream and Nord Stream 2.

The Energy Union is thus an attempt at centralising the issues pertaining to natural gas and the transfer of the point of gravity in this area from EU member states to EU institutions. A Polish proposal concentrated on the supplies of natural gas and the postulates concerned the decrease of dependence on gas supplies from Russia. Therefore solutions whose aim was to strengthen the EU in this respect were proposed (Pach-Gurgul, 2016b):
Foundation of one European Institution which could purchase gas for all the 28 EU member states, which would allow for the decrease of the disparity in the purchase prices within the EU;

- The introduction of a principle that in the case that one or a few EU member state(s) are facing the cutting off of gas supplies, other countries would provide them with assistance;

- Financing of up to 75% of the necessary institutions (gas collection reservoirs, pipelines) by the EU in countries which are most dependent on Russian gas;

- The necessity to use domestic energy carriers, mainly coal, and signing agreements for the purchase of gas from exporters from outside the EU;EU strengthening of the collaboration between the Energy Community, founded in 2005, and its eastern neighbours.

The Energy Union may thus guarantee the introduction and execution of the “fifth liberty” (after the freedom of movement of people, goods, services and capital) – the freedom of movement of energy within the entire territory of the EU.

On 25th February 2015 the European Commission officially adopted a package concerning the creation of the Energy Union (European Commission, 2015a). The package consists of three communications:

1) A framework strategy for the Energy Union;

2) The EU vision of a new global climate agreement;

3) The measures for meeting the target 10% of the electrical energy in inter-system connections by 2020.

*The framework strategy for a stable European Union* (European Commission, 2015a) defines three long-term objectives for EU policy: security of supplies, sustainability and competitiveness. The priorities of the Energy Union, promoted by the Polish government to only a minor degree, were reflected in the project proposed by the European Commission and eventually adopted by the member states in 2015. The proposal of the Polish government concentrated first of all on the union within the gas and oil sector and on the full use of the domestic energy carriers, such as hard coal and shale gas. The adopted package, however, focuses on the issues concerning electro-energy and also on the development of renewable sources of energy. Its core comprises five strongly interrelated areas:

1. Energy security, solidarity and confidence

   The objective is to increase the EU resistance towards external energy crises and decrease the EU’s dependence on specific fuel supplies and routes.

2. Internal energy sector which requires further measures

   A new impulse is needed to complete the works connected with the construction of the internal energy market: better inter-system connections, complete implementation and execution of the current regulations concerning energy.

3. Energy efficiency understood as a way of minimising energy demand

   Meeting the objective defined by the European Council in October 2014, concerning the improvement of energy efficiency by at least 27% to 2030. Energy efficiency must be increased in construction and transport sectors.

4. Decarbonisation of the economy

   The starting point aiming at meeting this objective is the EU climate policy based on the commitment to reduce greenhouse emissions in the EU by at least 40% in comparison with 1990.
5. Scientific research, innovation and competitiveness

The core of the Energy Union is intended to be focused on research and innovation. The EU should be a leader in the technologies of smart energy networks and smart houses, ecological transport, clean fuels and nuclear energy.

The strategy concerning the Energy Union is a very reduced version of the Polish proposal of joint gas purchasing. The document adopted by the European Commission only mentions that voluntary joint gas purchasing should be taken into consideration. The condition for such purchasing must be dependence on one supplier and the occurrence of a crisis in supplies.

The further part of the package, a document titled, *Paris protocol – tackling global climate change 2020* (European Commission, 2015b), presents the EU vision of the new global climate agreement which was to be adopted in December 2015 in Paris. The document specifies the aim of a 40% reduction in greenhouse gases by 2030. Eventually, after the December conference of 2015, the Paris Protocol was approved with one of its main provisions being the inhibition of the increase of an average temperature on the world on the level much below 2°C in comparison with preindustrial period and taking measures to make it not higher than 1.5°C.

The last part of the Energy Union package proposes meeting the 10% target of electrical energy in inter-system connections by 2020:

- The situation in 12 member states, where the inter-system connections do not reach 10%, must be improved (Ireland, Italy, Romania, Portugal, Estonia, Latvia, Lithuania, Great Britain, Spain, Poland, Cyprus and Malta);
- The realisation of projects planned within the TEN-E regulation and the Connecting Europe Facility (CEF) which will assist the increase of inter-system connections;
- Financial support for the projects concerning inter-system connections;
- Regional co-operation.

3. The Energy Tour and the main conclusions

A package on the creation of the Energy Union has been adopted. However, some doubts concerning the sense of its creation are frequently raised by politicians of specific member states. The “energy interest” of the countries of Central Eastern Europe, which are highly dependent on gas supplies from Russia and the energy interest of such countries as France or Germany or the ecological Denmark vary significantly.

Therefore, Maroš Šefčovič – the European Commissioner for the Energy Union, organised an Energy Union Tour, i.e. a series of meetings in all the member states, taking place at the turn of 2015–2016, the objective of which was to show what the Energy Union can offer for each of them: to begin with, a better interconnection of energy through an improvement in market competitiveness, to end with, the security of the gas supply etc. Each meeting was summarised with a comprehensive analysis and report presenting potential benefits of each state’s participation in the Energy Union. These conclusions were divided into five categories, in which the Energy Union may bring measurable benefits (cf. Table 1):

1) The Energy Union in the context of energy security;

4) The Energy Union in the context of energy efficiency;
5) The Energy Union in the context of research, innovation and competitiveness.

As can be seen from table 1, the “Old 15 EU countries” may benefit from the Energy Union in the context of the resale of developed technologies connected with renewable sources of energy, the development of trans-border connections and the execution of Projects of Common Interest related to the development of the gas and electricity infrastructure.

The countries of Central Eastern Europe, in turn, may benefit from energy security: diversification of energy sources, suppliers, direction of gas supply and regional cooperation. The Energy Union is intended to facilitate an increase of energy efficiency for countries in the transport or construction sectors. Another benefit for these countries might be support for the development of renewable sources of energy, and, thus for the transition to a low-carbon economy.

The countries which are the most isolated from the EU energy system, i.e. Malta and Cyprus, may first of all benefit from the implementation of the Projects of Common Interest, the development of trans-border connections, the construction of LNG storing premises, and the development of renewable sources of energy, which poses great problems for them (on account of their small territory and geographical conditions) as well as the transition to a low-carbon economy.

Conclusions

The Energy Union is a project in response to the gas crisis of 2009 between Russia and Ukraine and its consequences for the remaining countries of the EU. Its objectives consist of the integration of the 28 energy markets, guaranteeing the freedom of energy movement across the borders of the EU countries. New technologies, measures for energy efficiency and renewed infrastructure are intended to increase energy security, reduce household spending on energy, create new workplaces, facilitate the transition to a low-carbon economy and thus boost economic growth.

This is both an ambitious and expensive project. Therefore it is natural that the average EU citizen and member of the Energy Union wants to know what the project consists of and what it can offer their state. In his speech, Maroš Šefčovič, the European Commissioner for the Energy Union, stressed that “the project of European integration is not based solely on solidarity; a unified market reserves all the rights of the member states to the protection of their own interests. Therefor there is nothing wrong in citizens asking the question: “what can the Energy Union project offer us?” (http://ec.europa.eu/priorities/energy-union-tour_en).

Nevertheless, if the very initiative of the Energy Tour seemed interesting, the conclusions formulated after the end of the tour seem very general. It is difficult to determine whether the arguments quoted at the point of creation of the common energy policy and internal energy market can convince all member states to ensure full realisation of the provisions of the Energy Union and a move away from their own particular interests
concerning resources. It also seems that in spite of the efforts connected with carrying out the Energy Tour, the main difficulty in this project may be the diversified perception of relationships with Russian among various member states. These differences in their attitudes to the gas market and relationship with Russia may significantly inhibit the proper functioning of the Energy Union.
